excerpt from analytic geometry in accordance with the general plan of this series of textbooks the authors of the present volume have had constantly in mind the needs of the student who takes his mathematics primarily with a view to its applications as well as the needs of the student who pursues mathematics as an element of his education the processes of analytical geometry find their application for the most part in the scientific laboratory where it is often necessary to study the properties of a function from certain observed values the fundamental concept is therefore that of functional correspondence and the methods of representing such correspondence geometrically for this reason rather more than usual attention has been given to these subjects chapter iii also chapter ix arts 135 to 140 an intelligent appreciation of functional correspondence requires an intimate knowledge of the relation between an equation and the graphical representation of the functional correspondence determined by the equation such a knowledge is most easily obtained by a study of linear equations and equations of the second degree together with their corresponding loci this knowledge is not only of importance to the student of applied mathematics but it has a special disciplinary value for the general student the standard forms of the equations of a number of important loci are developed early chapter iv and the properties of these loci are discussed in detail later chapters vi and vii by means of the equations already at hand by this arrangement it is hoped that some unnecessary repetition has been avoided the equations of tangents to the conic sections have been derived by means of the discriminant of the quadratic equation whose roots are the 3 coordinates of the points of intersection with a variable secant rather than by means of the derivative about the publisher forgotten books publishes hundreds of thousands of rare and classic books find more at forgottenbooks.com this book is a reproduction of an important historical work forgotten books uses state of the art technology to digitally reconstruct the work preserving the original format whilst repairing imperfections present in the aged copy in rare cases an imperfection in the original such as a blemish or missing page may be replicated in our edition we do however repair the vast majority of imperfections successfully any imperfections that remain are intentionally left to preserve the state of such historical works

excerpt from the elements of analytic geometry analytic geometry is a broader subject than conic sections it is far more important to the student that he should acquire a familiarity with the analytic method and thoroughly grasp the generality of its processes and the comprehensiveness of its results than that he should obtain a detailed knowledge of any particular set of curves furthermore all branches of mathematics are fundamentally and inseparably related any subject therefore should be presented in such a way as to keep it in touch with all that has preceded and at the same time reach forward toward that which is immediately to follow to the end that there may be no sudden transition in passing from one branch to another algebra and geometry analytics and calculus are mutually helpful and should not be studied entirely apart no one of these subjects can be finished before the others are begun the general plan and scope of this book is due to a firm conviction of the soundness of these statements for this reason a fuller treatment than usual is given of the general analytic method before taking up the study of the conic sections and subjects have been introduced not ordinarily treated in text books on analytic geometry the method of the differential calculus is the only way of studying the slope of curves and furnishes the best means of finding the equation of the tangent and the normal the graphical method of illustration and the derivative are indispensable in the discussion of the

theory of equations the use of the derivative curve in the theory of equal roots together with the fact that the ordinate of the derivative curve is the slope of the integral curve naturally suggests a possible converse relation and leads easily and logically to the study of quadrature and maxima and minima it is believed that the elementary discussion of these subjects here given will tend to meet the needs of scientific and engineering students who now require a knowledge of the graphic method and the simple elements of the calculus at the earliest possible moment and that it will also be helpful to the general student who pursues the study of the subject no further about the publisher forgotten books publishes hundreds of thousands of rare and classic books find more at forgottenbooks.com this book is a reproduction of an important historical work forgotten books uses state of the art technology to digitally reconstruct the work preserving the original format whilst repairing imperfections present in the aged copy in rare cases an imperfection in the original such as a blemish or missing page may be replicated in our edition we do however repair the vast majority of imperfections successfully any imperfections that remain are intentionally left to preserve the state of such historical works

this historic book may have numerous typos and missing text purchasers can usually download a free scanned copy of the original book without typos from the publisher not indexed not illustrated 1898 edition excerpt find the similar relation for the hyperbola $y^2 - 4px = 81$ we have seen in 67 that if we take the axis of the parabola as the axis of x and the line through the vertex perpendicular to the axis of the parabola as the axis of y the equation of the parabola assumes its simplest form $y^2 = 4px$ this is the form of the equation we shall use in studying the parabola in this chapter when the equation is in this form the focus is the point $(p, 0)$ and the equations of the axis and the directrix are respectively $y = 0$ and $x = -p$ also according to 78 the polar for the point (x, y) is $y^2 = 2p(x + p)$ and the tangent at the point (x, y) if (x, y) is on the curve is $yy_1 = 2p(x + x_1)$ if however the tangent is determined by its slope m its equation by 476 is $y = mx + 2p$ 82 constructions since the eccentricity of the parabola is always unity it follows that every point of the parabola is equally distant from the focus and the directrix from this fact we derive the two following methods of construction 1 by compasses let F fig 77 be the focus and dd and fx be the directrix and the axis respectively of the parabola to be constructed the vertex v will be on the line fx halfway from F to dd to determine other points of the parabola draw a line ab parallel to dd and to the right of v with F as a centre and a radius equal to the distance from dd to ab describe an arc of a circle this arc will intersect ab at two points p and p' which will be points of the parabola proceeding in this way we may determine as many points of the curve as we wish 2 by a mechanical device as before F fig 78
